

## When Everything Counts

### UltraContact® UC6 SUV

The ultimate balance of performance, safety, comfort and handling between urban life and long distance trips.

- Excellent braking and cornering on wet roads.
- High level of traction, grip and safety on both dry and wet roads.
- A quiet and comfortable ride with reduced noise levels.
- You will receive excellent wear performance thanks to interlocked polymer compound equipped in every UC6 SUV tyre.

# UltraContact® UC6 SUV

Everything you need from a modern-day SUV tyre -  
When Perfection Counts.

## Technical highlights.

### Safety for confidence in any condition

In wet conditions, specially designed Aqua Drainage elements quickly drain water through a unique tube system into the tread grooves. At the same time, the water film under the pattern blocks is pushed into the Aqua Channel surface sipes that accelerates water evacuation into the main grooves.

The Chamfered Edge of the tread blocks prevent the "rolling-in-effect" during braking. The braking pressure is evenly distributed across the tread block surface for maximum contact area, which delivers enhanced braking performance.

### Unleash your driving pleasure

SUVs normally are heavier vehicles with a higher centre of gravity than passenger cars. This puts more load on tyres when braking and cornering. A Double Tie-bar structure in the tread design is placed in the lateral grooves on the shoulders to connect the blocks for higher stability and stiffness during braking.

During cornering the Double Tie-bar supports the blocks on the shoulders to form a solid tread element that stabilized the tread blocks and delivers direct feedback and high levels of grip.

The next evolution of the well-known Noise Breaker interrupts sound waves in the grooves and divides them into smaller less noisy waves resulting in a quieter ride.

### Venture further for longer

The polymer chains of the UC6 SUV tread compound are entangled and connected to each other to form an interlocked polymer network. This improves the wear performance and robustness of the tread.

The tread compound of the UC6 SUV contains silica reduces tyre rolling resistance for improves fuel efficiency.
